

NetworkWize

NETWORKWIZE TECHNOLOGIES PVT. LTD.

DATASHEET

DashOne is a comprehensive cutting-edge solution for the telecom and networking industry. It can seamlessly integrate with proprietary and/or open-source OSS, BSS, NMS, EMS, CRM, ERP, Incident Management, Automation, Application Monitoring solutions. The solution can be used by telecom service providers to provide value-added services (like show summary of Performance Management, Fault Management, Alarms, inventory management) to their end customers.

Features

User Management

The admin portal helps the user to maintain the user's profile. It also helps them to grant necessary access using Role Based Access Control (RBAC). The also enforces password policy.

Inventory Management

The DashOne Inventory module is designed to track, manage, and control all the devices associated. It helps the user to maintain the inventory Life cycle. The user can view the device statistics which may include configuration data, operational data, memory data, Disk Snapshot and CPU Snapshot. It provides a centralized report for all the devices. It also provides the client the IOX count information, health status, Operations status.

Authoritative Network Database

A single collection point for viewing protocol, network infrastructure (layer-2 and layer-3 devices), end-host, connectivity, switch-port, and all related IP data empowers IT to reduce mean time to repair (MTTR), exclude the network as a root cause, and confidently automate processes.

IP Address Management

IP address management (IPAM) is critical for today's IP networks to support initiatives like cloud, security, IPv6 deployment, VoIP, and more. Our IPAM portfolio consists a diverse set of products and services which enable you to manage your IP address space and associated DHCP and DNS servers. But to make things easier, we can take on the management for you. That way, you can focus on network initiatives while relying upon the skills and expertise of DashOne managed services to support your foundational IPAM functions. DashOne IPAM help organizations efficiently manage their IP address space, ensuring that IP addresses are allocated and utilized effectively. It provides tools and features to automate IP address assignment, track IP address usage, detect conflicts or overlaps, and simplify network administration tasks.

Integrated Workflows

Network management involves a wide variety of tasks that can be simplified by having access to all the necessary data for getting the work done from a single user interface.

Integrating discovery, port control, and permission request features into the workflows for managing core network services, multistep processes that leverage templates, attribute inheritance, and automation help admins perform more efficiently with the necessary checks and balances that ensure accuracy.

Tunable, Comprehensive Network Discovery

Gathering up-to-date Infrastructure and device data enables the network team to see and take action on networks and devices that are not currently managed within the IPAM database; you can't manage what you don't see. Comprehensive switch-port data refines the management of port resources as well as enabling "Use next available port" and "port reservation" features. Tunable discovery allows network teams to create schedules to "black out" discovery and switch-port operations by network in support of critical uptime and response requirements.
